**Alcohol link to energy drinks – study**

*Katharine Child*

ENERGY drinks are being linked to heavier and riskier drinking by teenagers.

New research shows that US teens who consume even one energy drink a week are more likely to binge-drink – considered by researchers as having six or more alcoholic drinks in a sitting.

The Journal of Paediatrics has just published the study that also showed American teens who consumed energy drinks were more likely to start drinking alcohol, even as early as age 12.

Researchers from the University of Dartmouth Norris Cotton Cancer Centre had a number of theories as to why energy drinks seemed to be correlated with heavier and riskier drinking.

Energy drinks, specifically caffeine, could make the drinker feel less drunk and less impaired than they actually were. “Caffeine may also counter the depressant effects of alcohol, increasing alertness and leading to a longer timeframe of drinking,” the study said.

Energy drinks are very popular with younger South Africans.

A report by Analytix in 2012 noted growing popularity of mixing drinks like Red Bull with vodka or other spirits.

More than 70% of energy drink consumers were aged between 15 and 39, with students using them at exam time.” (*The Herald, 4 May 2015*)
