Perhaps the most interesting epidemiological studies conducted during the 1918–1919 pandemic were the human experiments conducted by the Public Health Service and the U.S. Navy under the supervision of Milton Rosenau on Gallops Island, the quarantine station in Boston Harbor, and on Angel Island, its counterpart in San Francisco.

The experiment began with 100 volunteers from the Navy who had no history of influenza. Rosenau was the first to report on the experiments conducted at Gallops Island in November and December 1918.69.

His first volunteers received first one strain and then several strains of Pfeiffer's bacillus by spray and swab into their noses and throats and then into their eyes.

When that procedure failed to produce disease, others were inoculated with mixtures of other organisms isolated from the throats and noses of influenza patients.

Next, some volunteers received injections of blood from influenza patients. Finally, 13 of the volunteers were taken into an influenza ward and exposed to 10 influenza patients each. Each volunteer was to shake hands with each patient, to talk with him at close range, and to permit him to cough directly into his face.

None of the volunteers in these experiments developed influenza. Rosenau was clearly puzzled, and he cautioned against drawing conclusions from negative results.

He ended his article in JAMA with a telling acknowledgement: "We entered the outbreak with a notion that we knew the cause of the disease, and were quite sure we knew how it was transmitted from person to person. Perhaps, if we have learned anything, it is that we are not quite sure what we know about the disease."⁶⁹ (p. 313)

"Experiments Upon Volunteers to Determine Cause and Mode of Spread of Influenza." Boston, November and December" 1918.

1918-1919, during the Spanish Flu pandemic, Dr. Rosenau performed experiments in Boston. He did everything he could to transmit sickness from a sick patient to a healthy patient, including injecting bodily fluids and having them breathe into each other's mouths, but could not produce even one case of influenza. Contagion has never been proven and this is in line with the prophetic statement of "La Adwa." The doctor tried all he could to prove contagion as a cause but could not do so.... that's because the sickness came from Allah (swt).

This can be used as added evidence to refute the unislamic beliefs(amongst the many unislamic beliefs) of secular indoctrinated Muslim health practitioners.
